TIEA311 - Today in Jyväskylä (in Finnish)

The “steps of Jarno” (Ajattelumallia tehtävien ratkaisuun):

1. Luentomateriaali
2. Tehtävänanto (muista mitä aiemmissa tehtävissä on tehty/annettu)
3. Hae lähdekoodi ja testaa sen toiminta
4. Yhdistä teoria tehtävään ja lähdekoodiin, ymmärrä kokonaisuus
5. Hahmottele kevyt ”speksi” esim. paperille UML, prosessikaavio, ...

-
6. Tee osatehtävä 1
 7. Päivitä ”speksi”
 8. Tee osatehtävä 2
 9. Päivitä ”speksi”

...

MIT EECS 6.837 Computer Graphics

Part 2 – Rendering

Today: Intro to Rendering, Ray Casting

© NVIDIA Inc. All rights reserved. This content is excluded from our Creative Commons license. For more information, see <http://ocw.mit.edu/help/faq-fair-use/>.

The Story So Far

- Modeling
 - splines, hierarchies, transformations, meshes, etc.
- Animation
 - skinning, ODEs, masses and springs
- **Now we'll to see how to generate an image given a scene description!**

TIEA311 - Rest of the Course in Jyväskylä

The next slide is verbatim from the MIT OCW course. Here is the current plan for the remaining part of our adapted short version:

- ▶ Ray Casting: cover fully. Ray Tracing: cover the basic idea, skip details → possible to continue as a “hobby project”; NOTE: teachers of “TIEA306 Ohjelmointityö” may be contacted regarding the possibility of receiving credit for hobby projects.
- ▶ Shading, texture mapping: Cover the principles up to Phong model and texture coordinates.
- ▶ Rasterization, z-buffering: cover basic ideas
- ▶ Global Illumination, Monte Carlo techniques: skip this → could be suitable for bachelor thesis (introductory topics) or even master thesis (current state-of-the-art techniques)
- ▶ Image-based rendering: skip → defer to advanced courses (e.g. “TIES411 Koneäkö ja kuva-analyysi”)
- ▶ Sampling and antialiasing: mostly skip → defer theory to “TIES324 Signaalinkäsittely” and techniques (possibly) to “TIES471 Reaaliaikainen renderöinti”.
- ▶ Shadow techniques, Graphics Hardware → defer to TIES471.

The Remainder of the Term

- Ray Casting and Ray Tracing
- Intro to Global Illumination
 - Monte Carlo techniques, photon mapping, etc.
- Shading, texture mapping
 - What makes materials look like they do?
- Image-based Rendering
- Sampling and antialiasing
- Rasterization, z-buffering
- Shadow techniques
- Graphics Hardware

Today

- What does *rendering* mean?
- Basics of ray casting

**Pixel Color
Determined by
Lighting/Shading**

Rendering

- “Rendering” refers to the entire process that produces color values for pixels, given a 3D representation of the scene
- Pixels correspond to rays; need to figure out the **visible** scene point along each ray
 - Called “hidden surface problem” in older texts
 - “Visibility” is a more modern term
 - Also, we assume (for now) a single ray per pixel

Rendering

- “Rendering” refers to the entire process that produces color values for pixels
- Pixels correspond to rays; need to figure out the **visible** scene point along each ray
 - Called “hidden surface problem” in older texts
 - “Visibility” is a more modern term
 - Also, we assume (for now) a single ray per pixel
- Major algorithms: **Ray casting and rasterization**
- Note: We are assuming a pinhole camera (for now)

Questions?

Ray Casting

- Ray Casting Basics
- Camera and Ray Generation
- Ray-Plane Intersection
- Ray-Sphere Intersection

Ray Casting

For every pixel

Construct a ray from the eye

For every object in the scene

Find intersection with the ray

Keep if closest

Shading

For every pixel

Construct a ray from the eye

For every object in the scene

Find intersection with the ray

Keep if closest

Shade

Shading = What Surfaces Look Like

- Surface/Scene Properties

- surface normal
- direction to light
- viewpoint

- Material Properties

- Diffuse (matte)
- Specular (shiny)
- ...

- Light properties

- Position
- Intensity, ...

- Much more!

Diffuse sphere

Specular spheres

Ray Casting vs. Ray Tracing

- Let's think about shadows...

Ray Casting vs. Ray Tracing

Ray Casting vs. Ray Tracing

ray from light to hit
point is blocked, i.e.,
point is in shadow

This image is in the public domain.
Source: [opencipart](#)

Ray Casting vs. Ray Tracing

- Ray casting = eye rays only, tracing = also secondary

Secondary rays are used for testing shadows, doing reflections, refractions, etc.

This image is in the public domain.
Source: [opencipart](#)

We'll do all this a little later!

Questions?

Ray Casting

For every pixel

Construct a ray from the eye

For every object in the scene

Find intersection with the ray

Keep if closest

Shade depending on light and **normal** vector

Finding the **intersection point** and **normal** is the central part of ray casting

Ray Representation

- Origin – Point
- Direction – Vector
 - normalized is better
- Parametric line
 - $P(t) = \text{origin} + t * \text{direction}$

How would you represent a ray?

Ray Representation

- Origin – Point
- Direction – Vector
 - normalized is better
- Parametric line
 - $P(t) = \text{origin} + t * \text{direction}$

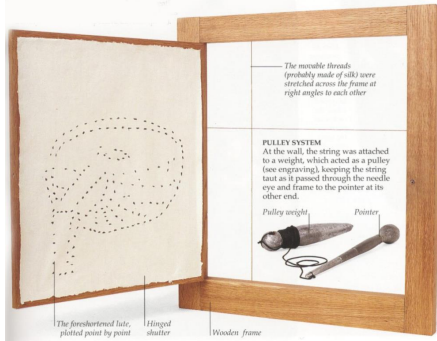

Another way to put the ray casting problem statement:

Find smallest $t > 0$ such that $P(t)$ lies on a surface in the scene

Dürer's Ray Casting Machine

Pinhole Camera

- Box with a tiny hole
- Inverted image
- Similar triangles
- Perfect image if hole infinitely small
- Pure geometric optics
- No depth of field issue (everything in focus)

Oldest Illustration

Ray Generation in 2D

Ray Generation in 2D

Corrections

CORRECTION: In the following few slides, the ideas are brilliantly visualized, but some of the equations are rubbish. These are OK:

$$\tan(\alpha/2) = 1/D \rightarrow D = 1/\tan(\alpha/2)$$

The others should read as:

$$\mathbf{r} = \mathbf{p} - \mathbf{e} = x\mathbf{u} + D\mathbf{w}$$

And (for the 3D case):

$$\mathbf{r} = x\mathbf{u} + \text{aspect} \cdot y\mathbf{v} + D\mathbf{w}$$

Ray Generation in 2D

Ray Generation in 2D

Ray Generation in 2D

then we just
normalize r to get
the ray

$$P(t) = e + td$$
$$(d = r / \|r\|)$$

view direction w

That was 2D, 3D is just as simple

- y coordinate is treated just like x , except accounting for aspect ratio
 - $\mathbf{r} = (x*\mathbf{u}, \text{aspect}*y*\mathbf{v}, D*\mathbf{w})$
 - Again, \mathbf{u} , \mathbf{v} , \mathbf{w} are the basis vectors of the view coordinate system
 - Aspect ratio handles non-square viewports
 - Think of your 16:9 widescreen TV
- The point of the exercise with computing D was to allow us to use the $[-1,1]$ image coordinate system regardless of field of view.

Perspective vs. Orthographic

perspective

orthographic

- Parallel projection
- No foreshortening
- No vanishing point

Orthographic Camera

- Ray Generation?
 - Origin = $\mathbf{e} + x \cdot \text{size} \cdot \mathbf{u} + y \cdot \text{size} \cdot \mathbf{v}$
 - Direction is constant: \mathbf{w}

Other Weird Cameras

- E.g. fish eye, omnimax, parabolic
