

Table of contents (note: this is a preliminary plan!)

Electrons in Solids (Elliott Ch 5)

- The free electron model
- The Fermi electron gas
- Electronic heat capacity
- Cohesive properties
- Electrons in a periodic potential
- Bloch theorem
- Nearly free electrons and energy bands
- Electrons in bonds
- Understanding band structures
- Breakdown of the independent electron model: screening, plasmons, metal-insulator transition
- Optical properties

Electron-electron interaction (Marder)

- Hartree and Hartree-Fock approximations
- Hartree-Fock of jellium model, screening
- Density-functional theory

Electron dynamics (Elliott Ch 6)

- Electrical conductivity
- Thermal conductivity
- Electron dynamics and periodic lattice
- Normal metals
- Superconductors

Dielectric properties (Elliott Ch 7)

- Dielectric functions and internal fields
- Piezoelectricity, pyroelectricity, ferroelectricity

Magnetism (Elliott Ch 7)

- Magnetic quantities, internal fields
- Diamagnetism
- Paramagnetism
- Spontaneous magnetization
- Ferromagnetism, antiferromagnetism, ferrimagnetism

Reduced dimensionality, nanostructures (Elliott Ch 8)

- Atomic clusters, fullerenes, quantum dots
- One-dimensional systems, nanotubes, nanowires
- Two-dimensional systems, heterojunctions, quantum wells
- ...
